FOOD AND DRUG ADMINISTRATION
APPROVED PRESCRIPTION DRUG PRODUCTS
- With Therapeutic Equivalence Evaluations -

I. PREFACE

The Approved Prescription Drug Products list (the List) provides a list of currently marketed prescription drug products that have been approved for marketing on the basis of safety and effectiveness by the Food and Drug Administration (FDA). In addition, it contains therapeutic equivalence evaluations for multiple source drug products. These evaluations have been prepared to promote public education in the area of drug product selection, to foster containment of health costs, and to serve State health agencies in the administration of their drug product selection laws.

For several years there has been a trend toward repeal of anti-substitution legislation that once was common in most States. In addition, most States have adopted laws intended to encourage or mandate the substitution of one product of a particular drug entity for another, with the intent of saving money for the consumer and containing costs in drug procurement and medical reimbursement programs. These State laws generally require that either substitution be limited to drugs on a specific list (the positive formulary approach) or that substitution be permitted for all drugs except those prohibited by a particular list (the negative formulary approach).

A number of States sought the assistance of FDA in preparing both positive and negative formularies. For example, on January 23, 1978 FDA responded to a request from the New York State Health Department to evaluate their list of drug products for therapeutic equivalence. Subsequently, a similar evaluation was made of a list submitted by the State of Illinois. The basic policies applied in evaluating these lists for the States of New York and Illinois are identical to the policies applied in developing this List.

Because of the number of requests for assistance in developing drug lists from other States, it became apparent that FDA could not serve the needs of each State on an individual basis. The Agency also recognized that a single list based on common policies would be preferable to attempting to evaluate drug products on the basis of differing definitions and criteria in various State laws. As a result, on May 31, 1978, the Commissioner of Food and Drugs sent a letter to officials of all States informing them of FDA's intention to prepare a list of all prescription drug products that are approved by FDA for safety and effectiveness, and, in the case of multi-source products, those products containing the same active ingredients and are identical in strength, dosage form, and route of administration that the Agency evaluates for therapeutic equivalence.

The Approved Prescription Drug Products list, which was distributed as a proposal in January, 1979, includes currently marketed prescription drug products approved by FDA through new drug applications (NDA's) or abbreviated new drug applications (ANDA's) under the provisions of section 505 of the Federal Food, Drug, and Cosmetic Act (the act), or in the case of antibiotics, through analogous applications known as Forms 5 or 6 under section 507 of the act. In preparing the List, FDA initially drew from its computerized files of approved drug submissions. In order to minimize the potential for error, an automated list of approved NDA's, ANDA's, and antibiotic Forms 5, as of April, 1978, was published as an interim document in May, 1978, and sent to State officials and agencies, including health officers, boards of pharmacy, and drug procurement agents, for review and comment. By notice published in the Federal Register of June 30, 1978 (43 FR 28557), the interim List was also made available to the public, with a request for additions, deletions, or corrections. In addition, on two separate occasions, FDA sent to each application holder data worksheets listing its products that FDA had identified as being approved, and corrections were solicited. The Agency received an excellent response with considerable updating information, indicating a serious and careful review by the firms. Information received in response to these requests was reviewed and when applicable was incorporated into the automated file. Information regarding approved antibiotic Forms 6 (the antibiotic application analogous to the ANDA) also was included. The List, together with its first supplement, contains approved NDA's, ANDA's, Forms 5, and Forms 6 through the last month prior to publication. Those prescription drug products for which approval has been withdrawn for whatever reason are excluded from the List.

The therapeutic equivalence evaluations in the List reflect FDA's application of specific criteria to the approved multisource drug products on the List. The evaluations are presented in the form of code letters that indicate the basis for the evaluation made. An explanation of the code appears in Introduction. The List, including the therapeutic equivalence evaluations, was distributed in January, 1979, as a proposal so that interested parties could review and comment on it. The first publication, October, 1980, reflected corrections and additions made as a result of those comments received. This publication, October, 1981, reflects all new approvals and data changes recorded since the first publication. Any product whose approval has been withdrawn or whose marketing has been discontinued has been removed from the list.

In addition to the list of approved drug products and therapeutic equivalence evaluations, this publication also includes: an index of drug products by trade or brand name, an index by name of the applicant (holder of the approved application), a list of applicants including an abbreviated name designation, and an addendum (DESI PENDING LIST) identifying drug products still being evaluated for effectiveness in the Drug Efficacy Study Implementation (DESI) program and those being evaluated for safety issues identified subsequent to 1962.

A complete discussion of the background and basis of FDA's therapeutic equivalence evaluation policy was published as a proposal in the Federal Register on January 12, 1979 (44 FR 2932). The final rule, which includes FDA's responses to the public comments received on the proposal, was published in the Federal Register on October 31, 1980 (45 FR 72582).

II. INTRODUCTION

A. DEFINITIONS

Approved Prescription Drug Products - This term refers to currently marketed prescription drug products approved by FDA through new drug applications (NDA's) or abbreviated new drug applications (ANDA's) under the provisions of section 505 of the Federal Food, Drug, and Cosmetic Act (the act) or, in the case of antibiotics, through analogous applications known as Forms 5 or Forms 6 under section 507 of the act. All drug products on the List have been fully reviewed and approved for safety and effectiveness by FDA. The law also permits drugs to be legally marketed without such fully approved applications under certain circumstances, but the drugs so marketed do not appear on the List. They consist primarily of: 1) drugs marketed prior to 1938 that are not subject to the pre-market clearance procedures of the law, and 2) drug products marketed between 1938 and 1962 that were approved for safety but not effectiveness ("deemed approved") and are still being reviewed under the administrative procedures of the Drug Efficacy Study Implementation (DESI) program. The drug products still in the DESI administrative process are listed in an addendum to the List.

Pharmaceutical Equivalents - Drug products are considered to be pharmaceutical equivalents if they contain the same active ingredients and are identical in strength, dosage form, and route of administration (e.g., chlordiazepoxide HCl, 5 mg. capsules, made by ~~two or more different manufacturers~~). Pharmaceutically equivalent drug products, sometimes called chemical equivalents, are formulated to contain the same amount of active ingredient in the same dosage form and to meet the same or comparable standards (i.e. identity, strength, purity and quality), but they may differ in characteristics such as color, taste, shape, packaging, expiration time, and, within certain limits, labeling.

Pharmaceutical Alternatives - Drug products are considered to be pharmaceutical alternatives if they contain the same therapeutic moiety but differ in the salt or ester of that moiety or in the dosage form or strength (e.g., tetracycline hydrochloride, 250 mg. capsules vs. tetracycline phosphate complex, 250 mg. capsules; diazepam, 2 mg. tablets vs. diazepam, 10 mg. tablets). Different dosage forms and strengths within a product line by a single manufacturer are thus pharmaceutical alternatives, as are controlled release products when compared with conventional formulations of the same active ingredient.

Therapeutic Equivalents - Drug products considered to be therapeutic equivalents are pharmaceutical equivalents and can be expected to have the same therapeutic effect when administered to patients under the conditions specified in the labeling. The concept of therapeutic equivalence, as used in developing the List, applies only to products containing the same active ingredients and does not encompass a comparison of pharmaceutical alternatives or two different active ingredients used for the same disease (e.g., propoxyphene HCl and pentazocine for the treatment of pain). FDA evaluates

as therapeutically equivalent those drug products that meet the following general criteria: (1) They are pharmaceutical equivalents in that they (a) contain identical amounts of the same active drug ingredient in the same dosage form, and (b) meet compendial or other applicable standards of identity, strength, quality, and purity; (2) They are bioequivalent in that (a) They do not present a known or potential bioinequivalence problem, or (b) If they do present such a known or potential problem, they are shown to meet an appropriate bioequivalence standard; (3) They are adequately labeled; (4) They are manufactured in compliance with Current Good Manufacturing Practice regulations.

FDA considers drug products to be therapeutically equivalent if they meet the criteria outlined above, even though they may differ in certain other characteristics, e.g., color, flavor, packaging, expiration time, and minor aspects of labeling. When such differences are important in the care of a particular patient, it is appropriate for the prescribing physician to require that a particular brand be dispensed as a medical necessity. As long as this consideration is met, however, FDA believes that products considered therapeutically equivalent can be substituted with the full expectation that the substituted product will produce the same therapeutic effect as the prescribed product.

B. GENERAL POLICIES GOVERNING THE LIST

The fundamental policy governing the List is that FDA considers pharmaceutically equivalent drug products to be therapeutically equivalent provided they are approved for both safety and effectiveness, are manufactured in accordance with Current Good Manufacturing Practice regulations, meet the same or equivalent standards, and, in those instances where positive evidence of bioavailability is necessary, are shown to be bioequivalent to an appropriate standard. The Agency believes this policy is consistent with the prevailing opinion of experts and with general experience in the marketplace through the years.

The Agency has considered, and rejected, the option of requiring in vivo bioavailability studies for every product. Such a policy would result in the testing in humans of a large number of products for which there is no evidence of a bioavailability problem, and would thereby waste the nation's clinical research resources on the repetitive testing of drug products for little or no scientific purpose. For this reason, FDA has elected under its bioavailability and bioequivalence regulations to confine in vivo testing of products for bioavailability to those particular drugs for which such testing is scientifically and medically necessary. In considering the therapeutic equivalence of drugs with known or potential bioavailability problems, the Agency has followed a policy of evaluating as therapeutic equivalents only those products that have met current requirements (in vivo testing in humans, in vitro dissolution rate requirements, or both, depending on the drug). When bioavailability or bioequivalence requirements are newly established, there is a transition period during which all manufacturers are required to submit information regarding their products. For this reason some manufacturers whose products may not have yet met the requirement are still legally marketed.

The Agency has excluded from the List those products that are known to be no longer marketed. Approved products now regarded as medical devices, biologics, or foods are also excluded from the List. In addition, approved drug products solely marketed abroad are excluded.

C. LEGAL STATUS OF THE LIST

The Approved Prescription Drug Products list contains only public information and advice. The List is not a recommendation as to which drug products persons should purchase, prescribe, dispense, or conversely, which products should be avoided. It does not impose any requirement or restriction upon any person. To the extent that the List identifies drug products approved for marketing under sections 505 and 507 of the Federal Food, Drug, and Cosmetic Act, it merely sets forth information to which the public is entitled under the Freedom of Information Act. Exclusion of a drug product from the List does not necessarily mean that the drug product is in violation of section 505 or 507 of the act, or that it is not safe or effective, or that it may not be therapeutically equivalent to other drug products. Rather, the exclusion is based on the fact that FDA has not evaluated the safety, effectiveness, and quality of the drug product. To the extent that the List sets forth FDA's evaluations of the therapeutic equivalence of drug products that have been approved, it contains FDA's advice to the public and to the States regarding an important public health matter. These evaluations do not constitute determinations that any products are in violation of the act or that any products are preferable to others. As explained in the Federal Register proposal of January 12, 1979 (44 FR 2932, at pp. 2937-2947), these evaluations are based on the application of certain criteria to information contained in FDA files to make these nonregulatory evaluations.

D. PRECAUTIONS TO USERS OF THE LIST

1. Need for usual professional care and performance in using the List.

The evaluations of therapeutic equivalence in this List are scientific and medical evaluations by FDA. Products evaluated as therapeutically equivalent can be expected, in the judgment of the FDA, to have equivalent therapeutic effect and equivalent potential for adverse effects when used under the conditions of labeling. However, these products may differ in other characteristics such as, for example, taste, color, packaging, expiration time, and, in some instances, labeling. If such products are substituted for each other, there is a potential for such problems as patient confusion due to differences in color or shape of tablets, less patient acceptance of certain products because of flavor, better stability of one product over another under adverse conditions of storage, allergic reactions in rare cases due to a coloring ingredient, as well as differences in purchase price to the patient. An FDA evaluation of therapeutic equivalence in no way relieves practitioners of their professional responsibilities in prescribing and dispensing such products with due care and with appropriate information to individual patients. In those uncommon circumstances where the characteristics of a specific product, other than its active ingredient,

are important in the therapy of a particular patient, the physician's specification of that product is appropriate. Pharmacists must also be familiar with the expiration times and labeling conditions for storage, particularly for reconstituted products, to assure that patients are properly advised when one product is substituted for another.

2. Only currently marketed prescription drug products are included on the List.

The List includes only those prescription drug products that have been approved for marketing under sections 505 and 507 of the act, and which are currently being marketed. FDA will remove from the List any drug product which is no longer being marketed, even though there remains an approved application for that product. Unmarketed products may periodically appear on the List, however, until FDA becomes aware of their non-marketed status. Conversely, when FDA becomes aware through the application review process that an approved drug product is being re-marketed, it will again be included on the List.

The marketability of most antibiotic drug products includes the requirement for certification (certain classes are exempt by regulation from premarketing certification). However, beginning with the second edition of the List, antibiotic products which have been approved since August 1, 1980, but have not yet been certified, will be listed unless the Agency knows that there is no intent to market. Antibiotic products approved prior to August 1, 1980, and not yet certified will not be listed. The Agency presumes that the holder of the approved application (applicant) does not intend to market under that application.

3. Multisource and single source drug products are included on the List.

In constructing the List, FDA has evaluated for therapeutic equivalence only multisource drug products, [i.e., those pharmaceutical equivalents available from more than one manufacturer.] For all multisource products a therapeutic equivalence code is included and, in addition, those products which are therapeutically equivalent are highlighted in bold face and underlined. Those products with approved applications that are single source are also included on the List for the sake of completeness, but no therapeutic equivalence code is included with such products. The details of these codes and the policies underlying them are discussed in section E.

4. Products on the List are identified by the names of holders of approved applications (applicants).

The products on the List are identified by the names of the holders of approved applications (applicants), rather than by the names of the actual manufacturers themselves. This is because the applicant may have, for example, had its product manufactured by a contract manufacturer and may simply be distributing the product for which it has obtained approval. In most instances, however, the manufacturer of the product is the applicant.

Although the products on the List are identified by the names of the applicants, several circumstances, such as changing corporate profiles, have made this determination a difficult one. The Agency feels that, based on intensive and continuing document reviews and on concurrence through communication with firms, the applicant designations on the List, in most cases, are correct.

As a general rule, the products on the List are not identified by the names of the distributors of those products. FDA does not believe that there is a feasible way at this time to maintain an up-to-date and complete list linking the products of each approved application with the distributors and relabelers handling those products. Products subject to an approved application are frequently manufactured for distributors, under the distributor's labeling, for marketing by the distributor. Because these distributors often shift their source of supply in the commercial marketplace without informing FDA, even if FDA were to attempt to expand the List to link distributors with holders of approved applications, it would not have ready access to the information necessary to do so.

To assist the user in relating the name of the firm on the product label (the marketer) to the applicant identified on the List in order to determine the product's therapeutic equivalence evaluation, the following should be noted. If the marketer is the applicant, the applicant identified on the List is the same as the name of the firm on the product label. If the Agency is unaware of a corporate relationship between the marketer and the applicant, the List identifies only the applicant. In this case, the List identifies the drug product (which is the subject of a single application) by its generic name if the product is available from more than one marketer, and by its brand name if the product is available from one marketer only.

5. Any product on the List is subject at all times to regulatory action.

From time to time approved products may be found to be in violation of one or more requirements of the Federal Food, Drug, and Cosmetic Act. In such circumstances, the Agency will commence appropriate enforcement action to remove the violative product from the market by voluntary recall or seizure. If the problem leading to the violation is continuing, so that there exists a risk of future noncomplying products entering the market, FDA will undertake steps to eliminate that risk, e.g., by court injunction, withdrawal of the approval of the marketing application, or revocation of the antibiotic certification. Where the violation is corrected by removal of the particular batch of the product from the market, no need exists to exclude the product from this List; the approval continues and other batches are not affected. Where additional preventive action is indicated, the Agency will utilize appropriate legal procedures to keep the product off the market. Such regulatory action, however, is independent of the inclusion of products in the List. The sole criterion for inclusion of marketed products in the List is their being the subject of an approved application. Marketed products will not be removed from the List until completion of FDA proceedings to withdraw approval of the product under sections 505 or 507, as

applicable. FDA believes that retention of a violative product on the List will not have any significant adverse health consequences because other legal tools are available to the Agency to prevent actual marketing of violative products.

It should also be noted that when there is a change in the information contained in FDA files concerning a multiple source drug product that is on the List, there exists the potential that the drug product will no longer meet the criteria for therapeutic equivalence as initially evaluated. In this instance, FDA will re-evaluate the drug's therapeutic equivalency by applying the current information to the criteria for therapeutic equivalence. If the re-evaluation reveals that the listed therapeutic equivalence evaluation is no longer accurate, the evaluation will be revised accordingly.

6. Patent status of drug products not considered.

The patent laws have no bearing on the enforcement of the Federal Food, Drug, and Cosmetic Act, and the Agency does not consider these laws when reviewing new drug applications and making drug product approval decisions. Thus, if a firm submits a drug application for a drug that is patented, FDA reviews the application without considering the patent issue. If the application is approvable, the existence of a patent would not affect the Agency's decision to grant approval for marketing.

E. CODES AND SPECIFIC POLICIES FOR THERAPEUTIC EQUIVALENCE EVALUATIONS

The coding system is constructed to allow users to determine quickly whether the Agency has evaluated a particular approved product as therapeutically equivalent to other pharmaceutically equivalent products. The coding system is also intended to provide specific information on the basis for FDA's evaluations. There are two classification categories into which multisource drugs have been placed, as follows:

A - Drug products that FDA considers to be therapeutically equivalent to other pharmaceutically equivalent products.

B - Drug products that FDA does not at this time consider to be therapeutically equivalent to other pharmaceutically equivalent products.

A two-letter code is used in the List. The first letter is the basic classification ("A" or "B") to which an individual drug product has been assigned. The second letter in the code designates a more specific reason for placing the individual product in that category. The codes are explained in this section of the introduction. Individual drug products have been evaluated as therapeutically equivalent in accordance with the definitions and policies outlined below.

A - Drug products that are considered to be therapeutically equivalent to other pharmaceutically equivalent products.

Drug products designated with an "A" code fall under one of two main policies: (1) For those active ingredients for which no bio-equivalence issue is known or suspected, the therapeutic equivalence of pharmaceutically equivalent products is presumed, so long as the products are manufactured in accordance with Current Good Manufacturing Practice regulations and meet the other requirements of their approved applications; (2) For those drug products containing active ingredients which have been identified by FDA as having actual or potential bioequivalence problems (21 CFR 320.22 or 42 FR 1648, January 7, 1977), an evaluation of therapeutic equivalence is assigned to pharmaceutical equivalents only if the approved NDA contains adequate scientific evidence supporting the bioequivalence of the product to a selected standard product. This evidence may be an in vivo bioavailability study or an in vitro dissolution rate study or both, depending upon the drug.

There are some general principles which may affect the substitution of pharmaceutically equivalent products in some specific cases. Prescribers and dispensers of drugs should be alert to these principles so as to deal appropriately with situations which require professional judgment and discretion.

1. There may be labeling differences among pharmaceutically equivalent products which require attention on the part of the health professional. For example, pharmaceutically equivalent powders to be reconstituted for administration as oral or injectable liquids may vary with respect to their expiration time or storage conditions after reconstitution. An FDA evaluation that such products are therapeutically equivalent is applicable only when such products are reconstituted, stored, and used under the conditions specified in the labeling of each product.

2. Occasionally there may be variations among pharmaceutically equivalent products in the labeling instructions on dose and administration. For example, a particular brand of an antibiotic might require administration on an empty stomach, while another brand might permit administration without regard to food intake on the basis of blood level studies done after administration in the presence of food. An FDA evaluation of therapeutic equivalence in such cases is applicable only when such products are taken in accordance with labeling directions for the particular product.

3. In some cases closely related products are listed as containing the same active ingredients but in somewhat differing amounts. In determining which of these products are pharmaceutically equivalent, the Agency has employed a criterion that products with labeled strengths of an ingredient that do not vary by more than 1% will be considered pharmaceutically equivalent.

4. Different salts and esters of the same therapeutic moiety are regarded as pharmaceutical alternatives. Such products are not considered to be therapeutically equivalent. There are no known instances in this List where pharmaceutical alternatives are coded as therapeutically equivalent. Anhydrous and hydrated entities are not considered as pharmaceutical equivalents unless they meet the same standards and, as in the case of ampicillin, their equivalence is supported by appropriate bioavailability/bioequivalence studies where necessary.

5. Drug products that are solids for reconstitution, diluted solutions, or concentrated solutions, and that contain different concentrations of active ingredients, are not considered pharmaceutical equivalents. Of course, the exercise of accepted professional practice may render pharmaceutically different concentrations into pharmaceutical equivalents (e.g., concentrated solutions may be diluted to lower strengths by using proper procedures designed to maintain the quality of the product).

6. Where package size variations have therapeutic implications, products so packaged have not been considered pharmaceutically equivalent. For example, some oral contraceptives are supplied in 21- and 28-tablet packets; the 28-tablet packets contain 7 placebo or iron tablets. These two packaging configurations are not regarded as pharmaceutically equivalent; thus they are not designated as therapeutically equivalent.

The specific sub-codes for those drugs evaluated as therapeutically equivalent and the policies underlying these codes are listed below:

AA Products not presenting bioequivalence problems, in conventional dosage forms

Products coded as AA are standard formulations of those active ingredients that are not regarded as presenting either actual or potential bioequivalence problems. In addition, the drug products of the active ingredient are manufactured in dosage forms (such as plain tablets, capsules, solutions, elixirs, syrups, and tinctures) not presenting bioequivalence problems.

AB Products meeting necessary bioequivalence requirements

The AB evaluation denotes products that contain an active ingredient in a dosage form that is subject to a bioequivalence requirement, or for which the submission of bioavailability data is required for approval, and for which the applicant has provided adequate studies to support the bioavailability and bioequivalence of its product. This category also includes those few drugs with more than one applicant but only one manufacturer. It should be noted that if only one product under a drug ingredient heading is coded AB, it signifies that only that product is supported by bioavailability data. It does not signify that this product is therapeutically equivalent to the other drugs under the same heading. Thus, one product of a drug ingredient heading, coded AB, is not therapeutically equivalent to a drug product under the same heading that is coded BD or BP. Only those drugs coded AB under the ingredient heading are considered therapeutically equivalent to each other.

AN Solutions and powders for aerosolization

Uncertainty regarding the therapeutic equivalence of aerosolized products arises primarily because of differences in the drug delivery system. Powders or solutions for aerosolization which are marketed for use in any of several delivery systems are considered to be pharmaceutically and therapeutically equivalent and are coded AN. Those products compatible only with, or which are a component of, a specific delivery system are classified BN, because drug products in their respective delivery systems are not necessarily pharmaceutically equivalent and therefore not therapeutically equivalent.

AO Injectable oil solutions

The absorption of drugs in injectable oil solutions may vary substantially with the type of oil employed as a vehicle and the concentration of the active ingredient. Injectable oil solutions are therefore considered to be pharmaceutically and therapeutically equivalent only when the active ingredient, its concentration, and the type of oil used as a vehicle are all identical.

AP Aqueous injectable (parenteral) solutions

All injectable products are listed under the general category Injectable; Injection, but specific routes of administration are not shown. Some multisource products that are pharmaceutical equivalents are labeled by their different applicants for different routes of administration. Injectable products available as dry powders for reconstitution, concentrated sterile solutions for dilution, or sterile solutions ready for injection, are all considered to be pharmaceutically and therapeutically equivalent provided they are designed to produce the same concentration for injection and are equivalently labeled. Consistent with accepted professional practice, it is the responsibility of the prescriber, dispenser, or individual administering the product to be familiar with a product's labeling to assure that it is given only by the route(s) of administration stated in the labeling.

Certain commonly used large volume intravenous products in glass containers are not included on the List (e.g., dextrose 5% with water, dextrose 10% with water, sodium chloride 0.9% injection). Virtually all of these drug products came on the market before 1938 and have not been required to obtain an approved NDA as a condition of marketing. When packaged in plastic containers, however, these same drug products are considered to be new drugs requiring approved NDA's for marketing. All large volume parenteral products are manufactured under similar standards, regardless of whether they are packaged in glass or plastic. Thus, FDA has no reason to believe that the packaging container of large volume parenteral drug products that are pharmaceutically equivalent would have any effect on their therapeutic equivalence.

AT Topical products

There are a variety of dosage forms available for topical, ophthalmic, otic, rectal and vaginal administration, including solutions, creams, ointments, gels, lotions, pastes, sprays, and some suppositories. Different topical dosage forms are not pharmaceutically equivalent even though they may contain the same active ingredient, and, therefore, they are not considered therapeutically equivalent. Products in the same topical dosage forms are, however, in the absence of contrary data, considered therapeutically equivalent if they are pharmaceutically equivalent.

B - Drug products that FDA does not at this time consider to be therapeutically equivalent to other pharmaceutically equivalent products.

Certain multisource drugs appearing on the List have been classified with a "B" code for several reasons. One reason is exemplified by those drugs that have been identified by the Agency as having potential or actual bioequivalence problems and for which adequate studies demonstrating the bioequivalence of the particular product have not been submitted to FDA. These are classified in the "B" category. A "B" evaluation often is associated with bioequivalence problems concerning comparability among specific dosage forms rather than problems with the active ingredient (ex., controlled release dosage forms). In addition, there are currently a few products for which the standards are inadequate or for which FDA has insufficient information at the present time to determine if they are therapeutically equivalent.

The specific coding definitions and policies for the "B" sub-codes are as follows:

BC Controlled release tablets, capsules, and injectables

These dosage forms are subject to bioavailability and bioequivalence differences, primarily because different firms developing controlled release products for the same active ingredient rarely employ the same approach to formulating their controlled release products. FDA, therefore, does not evaluate different controlled release dosage forms containing the same active ingredient in equal strength as bioequivalent unless equivalence between individual products has been specifically demonstrated through appropriate bioequivalence studies. Controlled release products for which bioequivalence data are available have been coded AB.

BD Active ingredient and/or dosage forms with documented bioequivalence problems

The BD code denotes products containing active ingredients with known bioequivalence problems, and for which adequate studies have not been submitted to FDA demonstrating the bioequivalence of the drug products. Where such studies are available, the product has been coded AB.

BE Enteric coated oral dosage forms

Drug products in enteric coated dosage forms containing the same active ingredients are subject to significant differences in absorption. In general, such products cannot be considered pharmaceutically equivalent because they do not necessarily meet similar standards, and few manufacturers of enteric coated products have studied the pharmacokinetics of their products. Unless otherwise specifically noted, the Agency does not consider different enteric coated products containing the same active ingredients as bioequivalent. If studies have demonstrated the bioequivalence of enteric coated products, such products are coded AB.

BN Products in aerosol-nebulizer drug delivery systems

This code only applies to drug solutions or powders that are marketed only as a component of, or are only compatible with, a specific drug delivery system. There may be significant differences, for example, in the dose of drug and particle size delivered by different products. Therefore, such products are not regarded as pharmaceutically equivalent.

BP Active ingredients and dosage forms with potential bioequivalence issues

FDA's bioequivalence regulations (21 CFR 320.52) contain criteria and procedures for determining whether a specific active ingredient in a specific dosage form has a potential for causing a bioequivalence problem. It is FDA's policy to consider an ingredient meeting these criteria as having a potential bioequivalence problem even in the absence of positive data demonstrating inequivalence. Pharmaceutically equivalent products containing these ingredients in oral dosage forms are included in this category pending resolution of their bioequivalence or lack of it.

Injectable suspensions containing an active ingredient suspended in an aqueous or oleaginous vehicle have also been included in this sub-category. Injectable suspensions are subject to bioequivalence problems because differences in particle size, polymorphic structure of the suspended active ingredient, or the suspension formulation can significantly affect the rate of release and the rate of absorption. FDA does not consider pharmaceutical equivalents of these products as being bioequivalent without adequate evidence of bioequivalence being presented to the Agency.

BR Suppositories or enemas for systemic use

The absorption of active ingredients from suppositories or enemas that are intended to have a systemic effect (as contrasted with suppositories administered for local effect) can vary significantly from product to product. Therefore, FDA considers pharmaceutically equivalent systemic suppositories or enemas as bioequivalent only if positive evidence of bioequivalence is available. In those cases where positive evidence is available, the product is coded AB. If such evidence is not available, the products are coded BR.

BS Products having drug standard deficiencies

If the drug standards for an active ingredient in a particular dosage form are found by FDA to be deficient so as to prevent an FDA evaluation of either pharmaceutical or therapeutic equivalence, all drug products containing that active ingredient in that dosage form are coded BS. For example, if the standards permit a wide variation in pharmacologically active components of the active ingredient such that pharmaceutical equivalence is in question, all products containing that active ingredient in that dosage form are coded BS.

BX Insufficient data

The code BX is assigned to specific drug products for which the Agency has insufficient data to determine the therapeutic equivalence status under the policies stated in this document. In these situations the drug products are presumed to be inequivalent until adequate information becomes available to make a full evaluation of therapeutic equivalence.

F. DESCRIPTION OF SPECIAL SITUATIONS

Certain drugs present special situations that deserve a more complete explanation than can be provided by the two-letter codes used in the List. These drugs have particular problems with standards of identity, analytical methodology, or bioequivalence that are in the process of resolution. The following are in this category:

1. Conjugated Estrogen and Esterified Estrogen Tablets - Data have been submitted to FDA indicating that there are significant differences in blood levels of the active ingredients produced by different conjugated estrogen tablets. These differences could affect therapeutic activity. They are believed to be directly related to the wide range of differences

permitted by the current official standards in the several active estrogenic steroids in conjugated estrogen products. Because of the wide range of the same active estrogenic steroids in esterified estrogens, this same concern extends to these products as well. FDA is working with the USP to revise the standards of identity for conjugated and esterified estrogens. Until such time as the standards issue is resolved, however, FDA is unable to conclude that conjugated estrogen or esterified estrogen tablets produced by different manufacturers are necessarily pharmaceutical equivalents. These products have thus been coded BS.

2. Erythromycin (Base) Tablets - All manufacturers of erythromycin base conventional and enteric coated tableted products initially demonstrated the bioavailability/bioequivalence of their products by performing such studies under fasting conditions. As a result of these initial tests all firms were required to label their products to be taken only under fasting conditions. Since that time, several firms have carried out additional studies to demonstrate that their products produce satisfactory blood levels when taken with food.

Those firms whose products have been demonstrated to provide satisfactory blood levels in the presence of food have been coded AB. Those products without benefit of studies demonstrating satisfactory blood levels when administered with food have been coded BX.

In addition, FDA has received new data which demonstrate the inequivalence of some erythromycin base tablets on a fasting basis. Until this matter is resolved, all erythromycin base tablets have been coded BX.

3. Erythromycin Stearate Tablets - All manufacturers of erythromycin stearate tableted products demonstrated the bioequivalency of their products as a condition of application approval. These bioequivalence studies were performed under fasting conditions and, as a result, all firms were required to label their products to be taken on an empty stomach. Since that time some firms have demonstrated that their products also may be taken immediately before meals, but not with meals, and still achieve acceptable blood levels. On the basis of such studies, FDA has approved those products to be labeled accordingly. At the same time, the Agency stresses that optimal absorption for any erythromycin stearate tablet is achieved when the drug is administered under fasting conditions, and recommends that prescriptions include instructions regarding administration in relation to meals. When erythromycin stearate tablets are to be administered under fasting conditions, the Agency believes that any listed brand coded AB may be considered therapeutically equivalent. If erythromycin stearate is to be taken immediately before meals, only those products with labeling that provides for such administration should be dispensed. Erythromycin stearate tableted products have been designated therapeutically equivalent (AB) in the List because all of the products produce equivalent blood levels provided the drug is prescribed and administered in accordance with the conditions of use in the labeling. Prescribers and dispensers are advised to be familiar with the labeling of these products.

4. Imipramine HCl Tablets - The Agency has determined that certain brands of imipramine tablets may undergo deterioration in their dissolution rate as the tablets age on the shelf, even under normal conditions of storage. FDA will be proposing to the USP a new dissolution rate standard to solve this problem. Those products that already meet the proposed new standard are coded AB. Products without data to support satisfactory dissolution are coded BP.

5. Amino Acid and Protein Hydrolysate Injections - Of these two types of products, only parenteral amino acid mixture solutions presently are listed as approved and marketed under NDA's. Protein hydrolysate injections are omitted because of safety problems. Because these products differ by the amount and kinds of amino acids they contain, they are not considered pharmaceutical equivalents. Thus, it is on this basis that FDA cannot evaluate these products as therapeutic equivalents. At the same time, the Agency believes that it is appropriate to point out that where nitrogen balance is the sole therapeutic objective and individual amino acid content is not a consideration, pharmaceutical alternative products with the same total amount of nitrogen content may be considered as therapeutically equivalent.

6. Phenytoin Sodium Capsules - This revision reflects two separate standards, one for prompt phenytoin sodium capsules USP and the other for extended phenytoin sodium capsules USP, which have been established by the U.S. Pharmacopeia in cooperation with FDA.

The labeling for these two types of phenytoin sodium capsules differ, reflecting differences identified in the standards. Extended phenytoin sodium capsules has a slower rate of absorption and it may be administered in once-a-day dosing, whereas prompt phenytoin sodium capsules may not. Changes between different brands of phenytoin sodium capsules, especially between prompt and extended forms, should be closely monitored by the physician, including blood level determinations, as noted in the labeling.

7. Prednisone Tablets - Because of known bioinequivalence and therapeutic inequivalence problems, the USP recently adopted a new in vitro dissolution test correlated with in vivo bioequivalence data. All products have been subject to a voluntary batch-to-batch certification program over the last two years to assure that products are in compliance with the USP dissolution requirement. Based on in vivo studies, FDA has published a proposal to establish the USP dissolution requirement as the bioequivalence requirement for prednisone tableted products. Determination of therapeutic equivalence for prednisone tableted products will be made after the evaluation of comments on that proposal. Until then, all prednisone products are coded BX.

8. Prednisolone Tablets - Although FDA-sponsored biopharmaceutic studies of prednisolone tablets have not revealed product bioinequivalence, a determination of the therapeutic equivalence of prednisolone tablets will not be made at present because of the close similarities between prednisolone and prednisone. Based on in vivo and in vitro studies, FDA has published a proposal to establish the dissolution requirement as the bioequivalence requirement for prednisolone tableted products. As with prednisone, determination of therapeutic equivalence will be made after evaluation of comments on this proposal. Until then, all prednisolone products are coded BX.

G. UPDATING PROCEDURES

FDA will provide cumulative monthly supplements furnishing, among other things, new drug approval information and, if necessary, revised therapeutic equivalence evaluations. All parts of this document will be subject to any changes and additions made in the supplements. A complete updated List will be published on an annual basis, and each subscription will include all monthly supplements in a given publication year.

III. DRUG PRODUCT LIST AND INDICES

A. FORMAT GUIDE

This publication contains the Drug Product List, three other lists or indices which facilitate its use, and an addendum.

1. Drug Product List

The Drug Product list contains product identification information (dosage forms, routes of administration, trade or generic names, applicants, strengths) for single and multiple ingredient drug products arranged alphabetically by active ingredient.

Product information for multiple ingredient products is listed alphabetically under the first active ingredient. For example, lidocaine hydrochloride with epinephrine appears under Epinephrine; Lidocaine Hydrochloride. A cross-reference to the product information appears for each additional active ingredient in the product.

If a product is multisource, a therapeutic equivalence code will appear in front of the applicant's name. If a product is therapeutically equivalent to one or more competing products or to an appropriate standard, it will be designated with a therapeutic equivalence code beginning with "A", and the entry will be underlined and printed in bold font.

To improve readability, standardized terms are used to designate dosage forms, routes of administration, and strengths. In some cases, the standardized terms used may differ from those used in labels and labeling.

Available strengths of a dosage form are separated by asterisks. For combination products, the ingredient strengths of a product are separated by semicolons and appear in the same relative sequence as do the ingredients in the heading.

To use the Drug Product List, determine the ingredient under which the product information is listed, using the Trade Name Index if appropriate. Then, find the ingredient in the Drug Product List. Proceed to the dosage form; route(s) of administration and compare products within that heading only. Therapeutic equivalence or inequivalence is determined on the basis of the therapeutic equivalence codes (highlighted by underlining/bolding within that specific dosage form heading for codes beginning with "A"). For further clarification see the annotated examples in Section B and Section C.

2. Trade Name Index

The Trade Name Index is a list of products by trade name or generic name. It also indicates the ingredient under which product information can be found in the Drug Product List.

3. Applicant Index

The Applicant Index is an index of products by applicant name. It also indicates the first alphabetically arranged ingredient under which product information can be found in the Drug Product List.

4. Applicant Abbreviation List

The Applicant Abbreviation List is an index of the applicant name abbreviations used in the lists.

B. DRUG PRODUCT EXAMPLES

Single Ingredient

Multiple Ingredients

With Product Information

With Cross-Reference

C. THERAPEUTIC EQUIVALENCE EVALUATIONS EXAMPLES

Drug products coded AB (or any code beginning with an "A") under an ingredient heading are considered therapeutically equivalent only to other products coded AB (or any code beginning with an "A") and NOT to those coded BP (or any code beginning with a "B") and any products not listed. For a complete explanation of the TE codes and policies refer to section E. of the INTRODUCTION.

		<u>SULFASALAZINE</u>		
		TABLET; ORAL		
Products considered <u>NOT</u> therapeutically equivalent to any other product listed or any standard	→	<u>AB</u>	<u>AZULFIDINE</u> PHARMACIA/PHARMACIA	<u>500MG</u>

Addendum: DESI PENDING LIST

The drug products in this addendum have issues pending resolution of either safety or effectiveness. They were either originally approved for safety between 1938 and 1962 ("Deemed Approved") or were approved subsequently as being identical, similar or related to those drug products. They do not appear in the Drug Product List because they have not received a final determination of effectiveness under the Drug Efficacy Study Implementation (DESI) review, or were not eligible for review under DESI but are under evaluation by the agency for safety issues. They are listed alphabetically by trade name. The applicant's name and first alphabetically listed active ingredient are also included.

The addendum is divided into the following classifications:

CURRENT STATUS - PROBABLY EFFECTIVE - Products that were first evaluated by the National Academy of Sciences, National Research Council (NAS/NRC) and then by the agency. These products were found to be probably effective and require additional evidence to substantiate labeling claims.

CURRENT STATUS - POSSIBLY EFFECTIVE - Products that were first evaluated by NAS/NRC and then by the agency. These products were found to be possibly effective and required additional evidence to substantiate labeling claims. Although products existed in this category for the proposed List, published in January, 1979, these products no longer exist in this category because their effectiveness issues have been resolved.

CURRENT STATUS - INEFFECTIVE - Products that were first evaluated by NAS/NRC and then by the agency. These products were found to lack evidence of effectiveness and are awaiting completion of administrative proceedings.

CURRENT STATUS - INEFFECTIVE AS COMBINATIONS/NEW SAFETY ISSUE - Products that were first evaluated by NAS/NRC and then by the agency. These products were found to lack substantial evidence of effectiveness as a fixed combination and present a safety issue. They are awaiting completion of administrative proceedings.

CURRENT STATUS - "EXEMPT" (COURT ORDER) - Products that are subject to Paragraph XIV of Federal District Court Judge William B. Bryant's order as published in the Federal Register of December 14, 1972 (37FR26623). The majority of these products were first evaluated by NAS/NRC and then later all were evaluated by FDA. These products were found to be less than effective, but a decision on whether to remove them from the market was deferred pending completion of additional clinical studies.

CURRENT STATUS - EFFECTIVENESS TO BE DETERMINED - Products that were not reviewed by NAS/NRC and which are undergoing agency evaluation for effectiveness.

CURRENT STATUS - EFFECTIVE/NEW SAFETY ISSUE - Products that were not reviewed through the DESI process and determined to be effective but subsequently which have been found to present a new safety issue. These products are awaiting completion of administrative proceedings.
